

Zephyria & the Universe – Frequently Asked Questions

A Reference Guide for the Cosmos Voice Assistant

Q: Where is Planet Zephyria located?

A: Zephyria orbits in the habitable zone of the binary star system Lyrus-7, approximately 340 light-years from Earth in the constellation Aquila. It lies within the Veil Nebula Cluster (VNC-4412).

Q: Is Zephyria bigger than Earth?

A: Yes. Zephyria has a diameter of 14,200 km compared to Earth's 12,742 km, making it about 11% wider. Its mass is 1.3 times Earth's, resulting in a surface gravity of 1.08 g — slightly stronger than Earth's.

Q: What does Zephyria look like from space?

A: From space, Zephyria appears as a deep sapphire-blue sphere with swirling white cloud systems. Its three moons are visible in close orbit. At night, the bioluminescent Luminar forests create faint greenish-gold glows visible along the continent of Valdris.

Q: How long is a Zephyrian year?

A: A Zephyrian year lasts 387 Earth days. A Zephyrian day is 28 Earth hours long.

Q: Who are the Velorians?

A: The Velorians are Zephyria's dominant sentient species — bipedal beings with four eyes, indigo-to-silver skin, and a lifespan of about 180 Zephyrian years. They communicate through a blend of tonal speech and bioelectric emotional signals. Their society has been peaceful for over 600 Zephyrian years.

Q: What is Zephyria's atmosphere made of?

A: Zephyria's atmosphere contains 74% nitrogen, 22% oxygen, 2% argon, and trace amounts of carbon dioxide, methane, and water vapour. Its higher oxygen content compared to Earth gives the sky a deeper blue hue.

Q: What are Luminar Trees?

A: Luminar Trees are the most iconic plants of Zephyria — bioluminescent giants growing up to 60 metres tall, with leaves that glow violet and gold at night. They photosynthesize using both visible and ultraviolet light.

Q: What is a Skyweaver?

A: Skyweavers are six-winged aerial creatures resembling manta rays crossed with jellyfish. They glide at altitudes up to 5,000 metres, filter-feeding on atmospheric spores. With wingspans up to 4 metres, they are considered sacred by the Velorians.

Q: Have Zephyrians made contact with Earth?

A: Zephyrian contact has been observational only. Humanity detected their biosignatures in 2087 and began beaming mathematical primer messages toward Lyrus-7 in 2092. The signals will not arrive for approximately 340 years.

Q: How old is the Universe?

A: The Universe is approximately 13.8 billion years old, dating from the Big Bang — the rapid expansion from an extremely hot, dense initial state.

Q: What is dark matter?

A: Dark matter is an invisible substance comprising about 27% of the Universe. It does not interact with light but exerts gravitational influence, holding galaxies together. Its true nature remains one of the biggest unsolved problems in physics.

Q: What are gravitational waves?

A: Gravitational waves are ripples in spacetime caused by accelerating massive objects, such as merging black holes. First predicted by Einstein in 1915 and detected in 2015 by LIGO,

they represent a new way to observe the Universe.

Q: How many planets are in our Solar System?

A: Our Solar System has 8 planets: Mercury, Venus, Earth, Mars, Jupiter, Saturn, Uranus, and Neptune. Pluto was reclassified as a dwarf planet in 2006.

Q: What is a light-year?

A: A light-year is the distance light travels in one year in a vacuum — approximately 9.46 trillion kilometres (5.88 trillion miles). It is used to express vast astronomical distances.

Q: What is the Milky Way?

A: The Milky Way is our home galaxy — a barred spiral galaxy containing 100–400 billion stars, spanning approximately 100,000 light-years. Our Solar System lies about 26,000 light-years from the galactic centre in the Orion Arm.

Q: What are the three moons of Zephyria called?

A: Zephyria's three moons are named Aela (the largest), Mira (a medium-sized reddish moon), and Dusk (a small, dark outer moon). Their combined tidal forces drive dramatic ocean currents and stunning aurora displays.

Q: What energy does Zephyrian civilization use?

A: The Velorian civilization runs entirely on renewable energy — tidal power from the three moons' gravitational pull, geothermal energy from Zephyria's active core, and solar energy from the binary star system Lyris-7.

Q: What is the Singing Peaks mountain range?

A: The Singing Peaks is Zephyria's tallest mountain range, located on the continent of Valdris, rising to 11,000 metres. The range is famous for the haunting, resonant tones produced when wind passes through crystalline rock formations.
